

Product Requirements Document (PRD)

Mobile & Web Banking Platform

Meridian Digital Bank — Dubai, United Arab Emirates

Document Version: 1.0

Status: Draft for Review

Prepared for: Product, Engineering, Design, Compliance & Risk

Regulatory Frame: Central Bank of the UAE (CBUAE)

Classification: Confidential — Internal Use Only

Table of Contents

- 1. Executive Summary
- 2. Purpose and Scope
- 3. Business Objectives and Success Metrics
- 4. Target Users and Personas
- 5. Assumptions, Constraints and Dependencies
- 6. Functional Requirements — Mobile Application
- 7. Functional Requirements — Web Banking Portal
- 8. Non-Functional Requirements
- 9. System Architecture
- 10. Data Architecture and Core Banking Integration
- 11. Security, Fraud Prevention and Regulatory Compliance
- 12. Third-Party and Ecosystem Integrations
- 13. Analytics, Notifications and Customer Engagement
- 14. Release Plan and Roadmap
- 15. Risks and Mitigations
- 16. Appendix — Glossary of Terms

1. Executive Summary

Meridian Digital Bank is planning a ground-up redesign of its customer-facing digital channels: a native mobile banking application (iOS and Android) and a companion web banking portal. The goal is to deliver a secure, fast, and delightful banking experience for retail and mass-affluent customers based in the United Arab Emirates, while meeting the regulatory expectations of the Central Bank of the UAE (CBUAE) and international card-scheme and data-security standards.

This Product Requirements Document (PRD) defines the functional scope, non-functional expectations, and target architecture for the first eighteen months of the program. It is intended to align Product, Engineering, Design, Risk, Compliance, and Information Security stakeholders around a shared definition of what is being built, why it matters to the business, and how it will be delivered.

The platform will support core retail banking journeys — onboarding, account opening, payments and transfers (domestic and international), card management, bill payments, savings goals, and customer support — through a unified backend that serves both the mobile app and the web portal from the same set of APIs. This ensures functional parity, reduces duplicated logic, and shortens the time to ship new features across channels.

Key differentiators for Meridian's digital channels include: biometric-first authentication, real-time payment notifications aligned with the UAE's Instant Payment Platform (IPP / Aani), Arabic and English bilingual experiences with full RTL support, in-app card controls, a conversational support layer, and a transparent, exportable view of fees and foreign-exchange rates for cross-border transfers — an area UAE customers frequently cite as a pain point with incumbent banking apps.

2. Purpose and Scope

2.1 Purpose

The purpose of this document is to describe, at a level suitable for engineering estimation and design sign-off, the functionality that the Meridian mobile app and web banking portal must deliver, the quality bar those experiences must meet, and the architecture that will support them at scale. It is a living document that will be revised as discovery, usability testing, and regulatory review progress.

2.2 In Scope

- Customer onboarding and digital KYC (Know Your Customer) for UAE residents and eligible non-residents.
- Retail deposit account servicing: current accounts, savings accounts, and fixed deposits.
- Domestic transfers, international remittances, and instant payments via the UAE's national instant payment rail.
- Debit and credit card management, including virtual cards, card controls, and tokenized wallet provisioning.
- Bill payments and merchant payments through UAE-based billers and aggregators.
- Savings goals, budgeting insights, and spend analytics.
- In-app and in-portal customer support, including secure messaging and a virtual assistant.
- A shared pipeline visualization and internal dashboard for monitoring transaction and support flows (operations tooling).
- Bilingual (Arabic/English) experience with full right-to-left (RTL) layout support.

2.3 Out of Scope (Phase 1)

- Corporate and business banking (SME and corporate portals are covered by a separate PRD).
- Wealth management, brokerage, and investment product execution.
- Islamic banking product variants (Murabaha, Ijara) — planned for a subsequent phase once Sharia-compliance review is complete.
- Physical branch and ATM software.
- Merchant acquiring and point-of-sale products.

3. Business Objectives and Success Metrics

The digital channel refresh is being funded against a small set of measurable business outcomes rather than as a purely technical modernization exercise. The table below summarizes the primary objectives and the metrics that will be tracked from launch.

Objective	Key Metric	Phase 1 Target
Reduce account opening friction	Time to open a current account, application start to funded account	Under 8 minutes for a UAE Emirates ID holder
Increase digital adoption	Share of monetary transactions completed digitally vs. branch/call centre	85% within 6 months of launch
Improve international transfer experience	Net Promoter Score (NPS) for remittance journey	+15 points vs. current app
Reduce support burden	Contact-centre calls per 1,000 digital active users	30% reduction within 9 months
Strengthen security posture	Confirmed account-takeover incidents per 100,000 users	Below industry benchmark, trending down quarter over quarter
Improve engagement	Monthly active users (MAU) as a share of total customer base	70% within 12 months

4. Target Users and Personas

Meridian serves a broad retail base across the seven emirates, with a concentration of customers in Dubai and Abu Dhabi. Three personas anchor design and prioritization decisions for this release.

Persona 1 — The Salaried Resident (“Amal”)

Amal is a UAE resident on an employment visa, paid via WPS (Wage Protection System) salary transfer. She uses her banking app primarily to check her balance, pay recurring bills such as DEWA and Etisalat/du, and send monthly remittances to family abroad. She is price-sensitive about FX margins and wants to see the all-in cost of a transfer before she confirms it. She switches between Arabic and English depending on the device she is using.

Persona 2 — The Mass-Affluent Professional (“Khalid”)

Khalid holds a current account, a savings account, and two credit cards with Meridian. He values fast in-app card controls (freezing a card, adjusting online-payment limits), rich transaction categorisation for expense tracking, and a web portal that lets him download statements and manage standing instructions from his desktop at work. He expects parity between the mobile app and the web portal — the same balance, same limits, same history — updated in real time.

Persona 3 — The New-to-Bank Applicant (“Sara”)

Sara is opening her first account with Meridian after relocating to Dubai. She expects a fully digital onboarding journey: document capture of her Emirates ID and passport, a liveness-checked selfie, and account activation without a branch visit wherever regulation allows. Any friction, ambiguous error message, or unclear document-quality requirement significantly increases her likelihood of abandoning the application.

5. Assumptions, Constraints and Dependencies

5.1 Assumptions

- Meridian's existing core banking system (CBS) exposes, or can be extended to expose, real-time account, transaction, and standing-order APIs.
- The bank has an existing relationship with a licensed UAE Pass or equivalent digital-identity provider for eKYC verification.
- Meridian is a direct or indirect participant in the UAE's national instant payment platform for real-time domestic transfers.
- A card-issuing processor is available for tokenized virtual card issuance and push-provisioning to mobile wallets.

5.2 Constraints

- All customer data relating to UAE residents must be stored and processed in a manner consistent with CBUAE data-residency and outsourcing guidance; where cloud infrastructure is used, it must be within an approved region and subject to a documented risk assessment.
- Any release touching payments, KYC, or account opening requires sign-off from Compliance and Risk prior to production deployment.
- The mobile app must support the two most recent major OS versions of iOS and Android at any given time.

- Arabic must be a first-class language, not a translated afterthought — this affects date formats, number formatting, currency placement, and layout mirroring.

5.3 Dependencies

- Core Banking System (CBS) team for account, ledger, and standing-instruction APIs.
- Fraud and Risk team for transaction-scoring rules and step-up authentication thresholds.
- Legal and Compliance for KYC/AML policy definitions and CBUAE regulatory sign-off.
- Card processor and scheme integration teams for tokenization and 3-D Secure.
- Marketing and Contact Centre for launch readiness and support-script updates.

6. Functional Requirements — Mobile Application

The mobile application is the primary channel for day-to-day banking. Requirements below are grouped by journey. Each journey lists the core capability and the key acceptance conditions engineering and QA should design against.

6.1 Onboarding and Digital KYC

- Prospective customers can start an application from the public app-store listing without an existing account.
- Emirates ID capture via camera with automatic edge detection, and passport/visa page capture for non-GCC nationals where applicable.
- Liveness-checked selfie match against the captured ID photograph, performed through a certified identity-verification vendor.
- Optional integration with UAE Pass for pre-filling verified identity attributes and reducing manual data entry.
- Real-time sanctions and PEP (Politically Exposed Person) screening triggered automatically as part of the application workflow, with manual review queued for any match.
- Clear, localized progress indicator showing remaining steps, and the ability to save and resume an in-progress application within a 7-day window.
- Instant account-number issuance upon approval, with card issuance and physical card dispatch tracked separately.

6.2 Authentication and Session Management

- Biometric login (Face ID / fingerprint) as the default returning-user experience, with device PIN as a fallback.
- Step-up authentication (one-time passcode via SMS or app-based push approval) required for high-risk actions: adding a new payee, raising transfer limits, or changing registered contact details.
- Automatic session timeout after a configurable period of inactivity, with a re-authentication prompt rather than a silent logout.
- Device-binding: a new device attempting to log in for the first time triggers an additional verification step before full access is granted.

6.3 Accounts Overview and Statements

- Consolidated dashboard showing all current accounts, savings accounts, fixed deposits, and cards with real-time balances.
- Transaction history with search, category filters, and date-range filters.
- Downloadable and shareable statements in PDF format, generated on demand for any selectable period.
- Ability to rename accounts with a personal nickname without affecting the underlying core-banking account name.

6.4 Payments and Transfers

- Domestic transfers between own accounts, to other Meridian customers, and to other UAE banks via the national instant payment rail, with confirmation of beneficiary name matching before the transfer is confirmed.
- International remittances with an upfront, itemized breakdown of the exchange rate applied, any transfer fee, and the estimated recipient amount — all shown before the customer confirms the transaction.

- Scheduled and recurring transfers (standing instructions), with the ability to view, edit, and cancel future-dated payments.
- QR-code-based person-to-person payments compatible with the national instant payment scheme.
- Beneficiary management: add, edit, remove, and re-verify saved beneficiaries, with a mandatory step-up authentication step for first-time additions.

6.5 Card Management

- View card details (masked PAN, expiry) and reveal full card number and CVV only after re-authentication, displayed for a limited time window.
- Freeze and unfreeze a card instantly from the app in the event of suspected loss or fraud.
- Granular controls: toggle online payments, contactless payments, international usage, and ATM withdrawals independently per card.
- Set or adjust daily and monthly spend limits per card, within limits allowed by the product and risk policy.
- Request a virtual card instantly for online purchases, and push-provision any card to Apple Pay or Google Pay directly from the app.
- Dispute a transaction directly from the transaction detail screen, opening a structured case with the disputes team.

6.6 Bill Payments and Merchant Payments

- Pay UAE utility and telecom billers (e.g., DEWA, Etisalat, du) directly within the app using a biller directory.
- Save billers as favourites and set reminders ahead of due dates.
- Scan-to-pay for merchant QR codes at point of sale.

6.7 Savings Goals and Insights

- Create named savings goals (e.g., “Umrah Trip”, “School Fees”) with a target amount and target date, and round-up or scheduled auto-contribution options.
- Spend-analysis view that automatically categorizes transactions (groceries, transport, dining, utilities) and shows month-over-month trends.
- Personalized nudges, such as an alert when spending in a category is trending above the customer's typical monthly pattern.

6.8 Customer Support

- In-app secure messaging with the contact centre, preserving conversation history and allowing attachment of screenshots or documents.
- A virtual assistant for common queries (balance checks, card freezing, branch/ATM locator) with a clear and immediate handoff to a human agent when the assistant cannot resolve the request.
- In-app service-request tracking (e.g., replacement card status, dispute case status) with status updates pushed via notification.

6.9 Notifications

- Real-time push notification for every debit, credit, and failed transaction attempt.
- Configurable notification preferences by category (transactions, marketing, security alerts, savings-goal progress).
- Critical security notifications (new device login, password/PIN change, card frozen) are never suppressible, regardless of user notification preferences.

7. Functional Requirements — Web Banking Portal

The web banking portal shares its backend and business logic with the mobile app and must maintain data and feature parity for all core servicing journeys. The web experience additionally emphasizes tasks that benefit from a larger screen and keyboard input: bulk actions, document downloads, and detailed statement review.

7.1 Parity Requirements

- Any balance, transaction, standing instruction, or card-control change made on one channel is reflected on the other within seconds, since both channels read and write through the same API layer.
- Login uses the same credential set as the mobile app; a second factor (OTP or app-based push approval sent to the registered mobile device) is required for web login by default.

7.2 Web-Specific Capabilities

- Bulk statement export across multiple accounts and a custom date range, downloadable as PDF or CSV.
- A dedicated “manage standing instructions” table view with inline edit and cancel actions across all scheduled payments.
- Print-optimized statement and transaction-receipt views.
- A session-security panel showing all currently active sessions and devices, with a one-click “log out of all other sessions” action.
- Downloadable tax and income certificates where the bank is required to issue them.

7.3 Accessibility and Localization

- Full Arabic-language support with right-to-left layout mirroring, not simply text translation.
- Compliance with WCAG 2.1 AA accessibility guidelines across both languages.
- Responsive layout supporting common desktop resolutions as well as tablet browsers.

7.4 Web Session Security

- Idle session timeout shorter than the mobile app default, given the shared-device risk profile of desktop browsers (e.g., internet cafes, shared work computers).
- No caching of account numbers, balances, or personal data in browser local storage; sensitive views are re-fetched from the API on each load.
- Mandatory re-authentication for any change to registered email, phone number, or password.

8. Non-Functional Requirements

8.1 Performance

- Cold app start to interactive dashboard in under 2.5 seconds on a mid-tier device over a 4G connection.
- API response time for account-summary and transaction-list endpoints under 400 milliseconds at the 95th percentile.
- The platform must sustain at least 5,000 concurrent authenticated sessions at launch, with horizontal scaling to at least 25,000 concurrent sessions within the first year.

8.2 Availability and Resilience

- Target availability of 99.9% for customer-facing services, measured monthly, excluding pre-agreed maintenance windows.
- Graceful degradation: if the core banking system is temporarily unreachable, the app should surface a clear, honest status message rather than an unhandled error, and should allow read access to recently cached, clearly timestamped balances where policy permits.
- Multi-availability-zone deployment for all customer-facing services, with automated failover and no single point of failure in the payments path.

8.3 Security

- All data in transit encrypted with TLS 1.2 or higher; all sensitive data at rest encrypted using industry-standard algorithms with managed key rotation.
- PCI DSS compliance for any component that stores, processes, or transmits cardholder data.
- Mandatory penetration testing prior to major releases and on a recurring annual cadence.
- Full audit logging of all account-modifying actions, retained in line with CBUAE record-keeping requirements.

8.4 Usability

- Core transactional journeys (check balance, transfer funds, pay a bill) achievable in three taps or fewer from the home screen.
- Consistent design system shared across mobile and web to reduce relearning cost when a customer switches channels.

8.5 Maintainability and Observability

- Centralized structured logging and distributed tracing across all services to support root-cause analysis of production incidents.
- Feature flagging for all new customer-facing capabilities, allowing staged rollout and fast rollback without a full redeploy.
- Automated test coverage gating merges to the main branch for all payment- and authentication-related services.

9. System Architecture

The platform follows a layered, API-first architecture. Both the mobile app and the web portal are thin clients over a shared set of backend services; no business logic is duplicated per channel. The architecture is organized into five layers, described below, followed by a summary of the recommended technology stack.

9.1 Layer 1 — Client Applications

Native iOS (Swift) and Android (Kotlin) applications, and a responsive single-page web application, share a common design-token library and a common client-side SDK that wraps authentication, API calls, and error handling. Clients hold no durable secrets; session tokens are short-lived and refreshed through the API gateway.

9.2 Layer 2 — Edge and API Gateway

- A single API gateway terminates all client traffic, enforcing TLS, rate limiting, request validation, and bot/device-fingerprint checks.
- The gateway performs token validation (OAuth 2.0 / OpenID Connect) and routes authenticated requests to the appropriate backend service.
- A web application firewall (WAF) and DDoS protection sit in front of the gateway.

9.3 Layer 3 — Core Domain Services (Microservices)

Business capabilities are split into independently deployable services, each owning its own data store where practical. Representative services include:

- Identity & Authentication Service — login, biometric/device binding, OTP issuance and verification, session management.
- Onboarding & KYC Service — orchestrates document capture, identity-verification vendor calls, sanctions/PEP screening, and application-state tracking.
- Accounts Service — a read-optimized facade over the core banking system for balances, statements, and account metadata.
- Payments Service — orchestrates domestic transfers, instant payments, and international remittances, including beneficiary management and FX-quote retrieval.
- Cards Service — integrates with the card processor for card issuance, tokenization, controls, and dispute initiation.
- Notifications Service — push, SMS, and email dispatch, with user-level preference management.
- Support Service — secure messaging, virtual-assistant orchestration, and service-request/case tracking.
- Insights Service — transaction categorization, savings goals, and spend analytics.

Services communicate synchronously via internal REST/gRPC calls for request-response needs, and asynchronously via an event bus for state changes that other services need to react to (for example, a completed payment event triggering both a notification and an insights-service update).

9.4 Layer 4 — Data and Messaging Infrastructure

- Each domain service owns a dedicated relational database (transactional integrity for accounts, payments, and cards) with read replicas for reporting workloads.
- A distributed cache layer serves frequently read, slower-changing data (e.g., biller directories, FX-rate snapshots) to reduce core-banking load.
- An event bus / message broker decouples services for asynchronous workflows such as notification dispatch, fraud-scoring callbacks, and analytics ingestion.

- A data warehouse receives streamed, anonymized events for regulatory reporting, analytics, and the internal operations dashboard.

9.5 Layer 5 — Core Banking and External Integrations

The domain services integrate with Meridian's core banking system (ledger of record), the national instant payment platform, card-scheme and processor networks, the identity-verification vendor, and SMS/push notification providers. All outbound integrations pass through an integration layer that normalizes protocols (SOAP, ISO 20022 messaging, REST) into a consistent internal contract, isolating domain services from core-system change.

9.6 Recommended Technology Stack

Layer	Recommended Technology	Notes
Mobile clients	Swift (iOS), Kotlin (Android)	Native for best biometric, push, and wallet-provisioning integration
Web client	React with a component design system	Shared design tokens with mobile for visual and interaction parity
API Gateway	Managed API gateway with WAF	Centralized auth, rate limiting, request validation
Backend services	Containerized microservices (Java/Kotlin or Node.js), orchestrated on Kubernetes	Independent scaling and deployment per domain service
Data stores	Relational database per service, with read replicas	Strong consistency for ledgers and payment state
Cache	In-memory distributed cache	Low-latency reads for reference data
Messaging	Managed event-streaming platform	Decouples services; supports async workflows and analytics ingestion
Identity	OAuth 2.0 / OpenID Connect provider	Central session and token issuance
Observability	Centralized logging, metrics, and distributed tracing	Single pane of glass across all services
Infrastructure	Cloud region approved for UAE data residency, or on-premises/hybrid per CBUAE outsourcing policy	Subject to Compliance and Risk sign-off

9.7 Architecture Overview Diagram

Figure 1: Layered architecture showing client applications, the edge/API gateway, core domain microservices, data and messaging infrastructure, and integrations with core banking and external partners.

10. Data Architecture and Core Banking Integration

The core banking system remains the system of record for balances and the general ledger. Digital-channel services maintain their own operational data — sessions, device registrations, notification preferences, saved beneficiaries, savings goals, and support cases — while reading authoritative financial data from the core banking system in real time or via a short-lived cache with clear staleness indicators.

10.1 Key Data Domains

Domain	Owning Service	Examples of Data Held
Customer Identity	Identity & Onboarding Service	Login credentials, biometric references (on-device only), device registrations, KYC status
Accounts & Ledger	Core Banking System (source of truth)	Balances, transaction history, standing instructions
Payments	Payments Service	Payment initiation records, beneficiary list, FX-quote snapshots
Cards	Cards Service	Tokenized card references, control settings, dispute cases
Engagement	Insights / Notifications Service	Savings goals, spend categories, notification preferences
Support	Support Service	Secure message threads, case status, attachments (metadata only, files in secure storage)

10.2 Synchronization Principles

- Balances and transaction history are never persisted long-term in the digital-channel data store beyond a short operational cache used to improve perceived performance; the core banking system remains authoritative at all times.
- Any write operation (a transfer, a card-control change) is confirmed against the core banking system before being reported as successful to the customer; the UI never shows an optimistic success state for money-movement actions.
- Reconciliation jobs run on a scheduled basis to detect and alert on any drift between cached read-models and the core banking system.

11. Security, Fraud Prevention and Regulatory Compliance

11.1 Regulatory Alignment

As a UAE-licensed bank, Meridian's digital channels must be designed and operated in line with applicable Central Bank of the UAE (CBUAE) regulations, including expectations around consumer protection, outsourcing and cloud usage, payment services, and anti-money-laundering / counter-terrorist-financing (AML/CFT) controls. Compliance and Legal must review and approve the KYC workflow, transaction-monitoring thresholds, and any use of third-party or cloud infrastructure before go-live.

11.2 Authentication and Access Controls

- Multi-factor authentication for login, with biometric as the primary factor on mobile and OTP/push approval as a secondary factor on web.
- Step-up authentication for high-risk actions, calibrated by a risk-scoring engine that considers device reputation, transaction amount, beneficiary novelty, and behavioural signals.
- Role-based access control for all internal tooling used by contact-centre and operations staff, with full audit trails of any customer-data access.

11.3 Fraud Prevention

- Real-time transaction scoring integrated into the payments flow, capable of declining, holding for review, or requiring step-up authentication based on risk score.
- Device fingerprinting and velocity checks (e.g., unusual number of new beneficiaries added in a short window) feeding into the fraud engine.
- A dedicated, clearly signposted in-app “report fraud / freeze my account” action available even to a logged-out user via the app's support entry point.

11.4 Data Protection

- Encryption in transit (TLS 1.2+) and at rest for all customer data, with card data specifically scoped for PCI DSS compliance.
- Data minimization: mobile and web clients only ever receive the fields required to render the current screen, never a full customer profile.
- A documented data-retention schedule aligned with CBUAE record-keeping requirements, with clear deletion or anonymization rules for data no longer required.

12. Third-Party and Ecosystem Integrations

Integration	Purpose
National Instant Payment Platform	Real-time domestic transfers and QR-based peer-to-peer payments
Identity Verification Vendor	Document capture validation, liveness detection, and face-match for onboarding
UAE Pass (or equivalent digital identity)	Pre-verified identity attributes to streamline onboarding
Card Processor / Scheme Network	Card issuance, tokenization, transaction authorization, and dispute processing
Mobile Wallets	Push provisioning of tokenized cards for contactless payment
SMS and Push Notification Gateways	Delivery of OTPs and transaction/security alerts
Biller Aggregator	Directory and payment processing for utility and telecom bills
Credit Bureau	Credit checks supporting card and lending product eligibility

13. Analytics, Notifications and Customer Engagement

Digital-channel usage will be instrumented from day one to support both product iteration and the business metrics defined in Section 3. Event-level telemetry (screen views, feature usage, drop-off points in funnels such as onboarding and international transfers) is captured with clear consent and anonymized before being used for aggregate reporting.

13.1 Internal Operations Dashboard

An internal dashboard, available to Product, Operations, and Risk teams, visualizes the end-to-end pipeline for key journeys — for example, the stages of the onboarding funnel from application start through KYC screening to account activation, and the stages of a payment from initiation through fraud screening to settlement confirmation. This gives non-technical stakeholders visibility into where customers or transactions are getting stuck without needing to query production databases directly.

13.2 Customer Notification Strategy

- Transactional notifications (money movement, security events) are sent through the most reliable available channel and are never gated behind marketing consent.
- Engagement notifications (savings-goal progress, spend insights, product offers) respect granular, per-category opt-in/opt-out preferences.
- A/B testing framework for notification copy and timing, governed by a shared experimentation policy to avoid notification fatigue.

14. Release Plan and Roadmap

Phase	Timeframe	Key Deliverables
Phase 0 — Foundation	Months 1–3	API gateway, identity service, design system, core CI/CD pipeline, cloud/on-prem environment approved by Compliance
Phase 1 — Core Launch	Months 4–8	Digital onboarding, accounts overview, domestic transfers, card view and freeze/unfreeze, push notifications, Arabic/English parity
Phase 2 — Payments Depth	Months 9–12	International remittances with FX transparency, standing instructions, bill payments, virtual cards, wallet provisioning
Phase 3 — Engagement	Months 13–15	Savings goals, spend insights, in-app secure messaging, virtual assistant
Phase 4 — Optimization	Months 16–18	Performance hardening, expanded fraud-scoring rules, accessibility audit remediation, operations-dashboard enhancements

Each phase concludes with a regulatory and security review gate; no phase progresses to production release for real customer funds without documented sign-off from Compliance, Risk, and Information Security.

15. Risks and Mitigations

Risk	Impact	Mitigation
Core banking system cannot expose real-time APIs at required latency	Delays to payments and account-overview features	Early technical spike with CBS team; build a caching/facade layer with clear staleness handling as a fallback
Regulatory approval for cloud data residency is delayed or denied	Infrastructure re-architecture required late in the program	Engage Compliance and CBUAE guidance early; design for on-premises or hybrid deployment as a fallback option
Onboarding drop-off remains high despite digital KYC	Slower customer acquisition than targeted	Continuous funnel analytics, usability testing with target personas, and iterative UX refinement
Fraud losses increase as digital adoption grows	Financial loss and reputational damage	Layered fraud controls, phased rollout of higher transaction limits, and ongoing tuning of the risk-scoring engine
Arabic/RTL experience treated as secondary during build	Poor experience for a significant customer segment	Arabic and RTL included in every design review and QA cycle from the outset, not retrofitted

16. Appendix — Glossary of Terms

Term	Definition
CBUAE	Central Bank of the United Arab Emirates, the primary banking regulator
KYC	Know Your Customer — the process of verifying a customer's identity
AML/CFT	Anti-Money Laundering / Countering the Financing of Terrorism
PEP	Politically Exposed Person — an individual subject to enhanced due diligence
IPP	Instant Payment Platform — the UAE's national real-time payment rail
OTP	One-Time Passcode used for step-up authentication
PCI DSS	Payment Card Industry Data Security Standard
RTL	Right-to-Left text layout, required for Arabic
WCAG	Web Content Accessibility Guidelines
MAU	Monthly Active Users
NPS	Net Promoter Score, a customer-loyalty metric
CBS	Core Banking System, the system of record for accounts and ledgers

End of document. This PRD will be revised as discovery, design validation, and regulatory review progress; refer to the version history maintained in the product team's collaboration workspace for the latest approved revision.
